## 範例arduinoDHT範例說明

### 學習目地

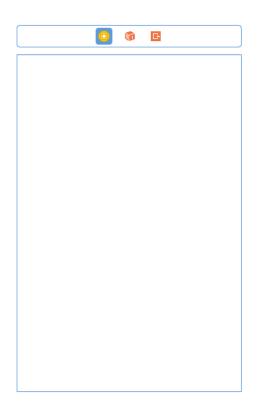

- 連結Firebase資料庫
- ·讀取Firebase資料庫節點資料
- 加入監聽器

至Firebase console下載GoogleService-inof.plist,並且加入至專案中。

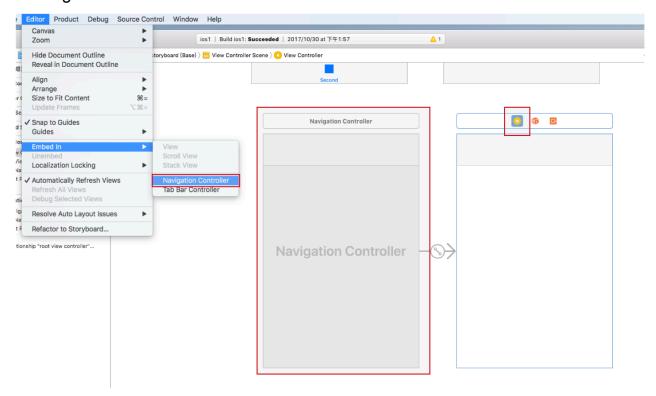

#### 建立UI介面

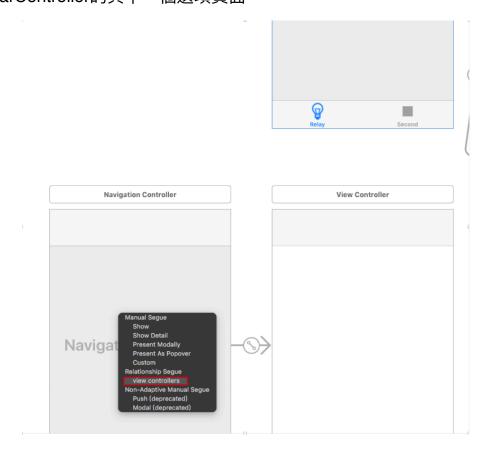

在storyboard內加入一頁新的 UIViewController頁面

選取UIViewController,點選Editor->Embed in -> Navigation Controller,加入UINavigationController。

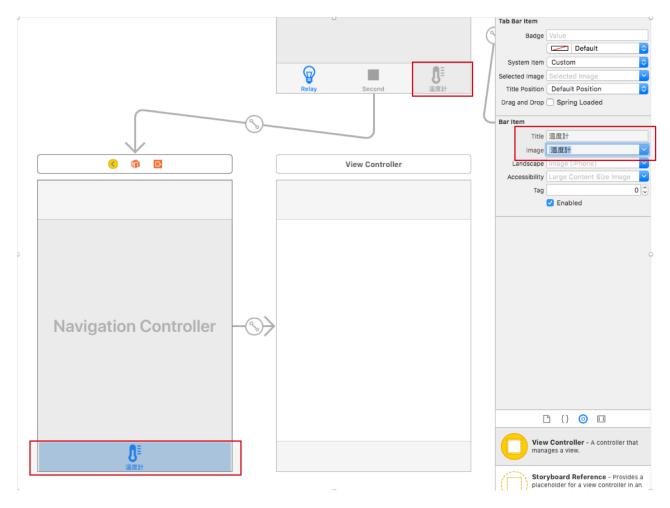

按住Control鍵,將滑鼠從UITabBarrController拖曳至UINavigationController,放開滑鼠,將會看到多個選項,選取View Controllers,將會使UINavigationController成為UITabBarController的其中一個選項頁面。

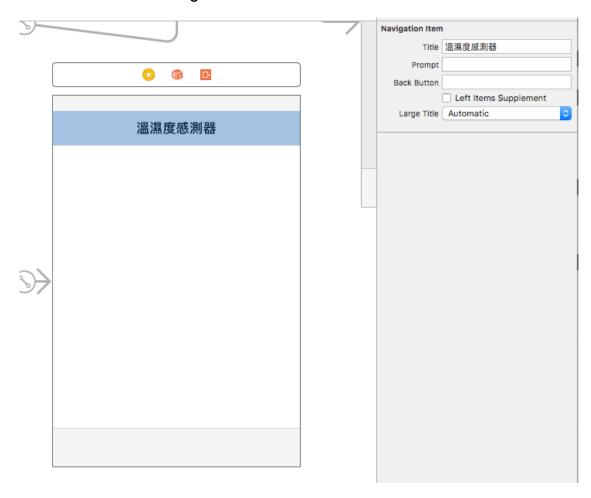

## 解壓縮溫度計.zip,並加入至專案的Assests內。

點選UINavigationController的TabBarItem,將Title改為溫度計,image也選擇溫度計。

選取UIViewConroller的NavigationItem,並修改Title為溫濕度感測器。

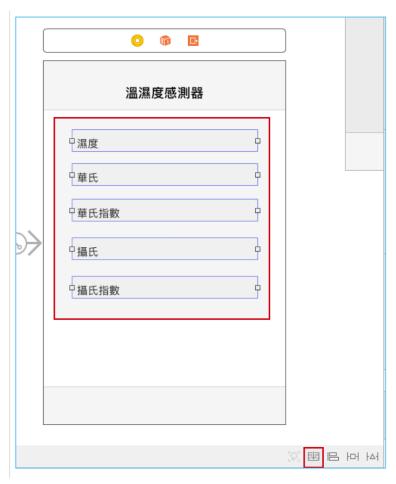

在View內,加入5個UITextField,並將內容依序改為濕度,華氏,華氏指數,攝氏,攝氏指數,取消選取每個UITextField的Control內的Enable

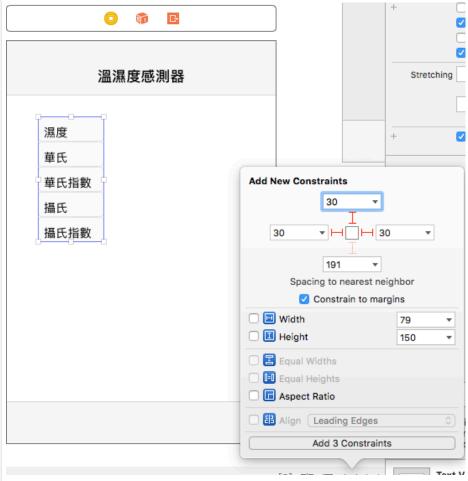

選取全部UITextField,加上 stackView。

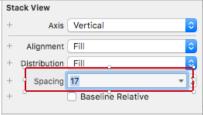

將StackView加上 上,左,右的 Constraints。

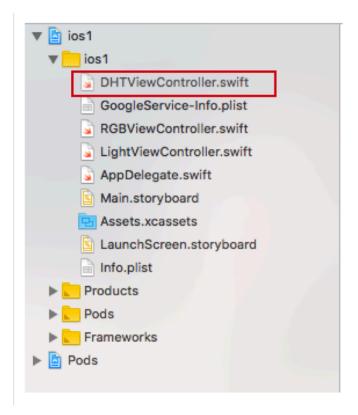

## 將stack View的Spacing改為17

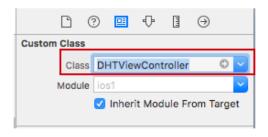

# 建立DHTViewConroller.swift,並且繼承UIViewConroller

#### 將溫濕度頁面改為DHTViewController

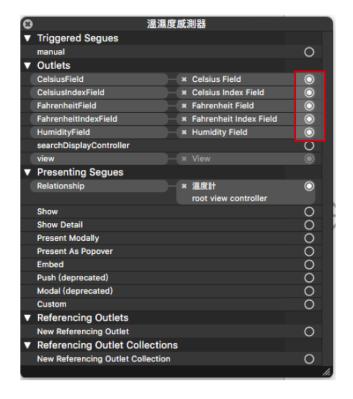

#### 在DHTViewController Class內建立IBOutlet的5個變數。

- @IBOutlet weak var HumidityField: UITextField!
- @IBOutlet weak var FahrenheitField: UITextField!
- @IBOutlet weak var FahrenheitIndexField: UITextField!
- @IBOutlet weak var CelsiusField: UITextField!
- @IBOutlet weak var CelsiusIndexField: UITextField!

點選Storyboard的DHTViewController,並按下右鍵,將出現DHTViewController class頁面的控制項,連結至View內適當的UITextField。

#### 加入程式碼

#### 載入Module 和建立節點。

```
//載入Firebase Module
import Firebase
//建立節點參考
lazy var DHTref:DatabaseReference! =
Database.database().reference(withPath: "DHT");
```

#### 建立自訂Methos delay(targetField:changedValue:)

```
//建立自訂method delay, 主要功能在於讓text Field文字更改為紅色,0.5秒後,自動回復成為黑色。
func delay(targetField field:UITextField,changedValue value:String){
    field.textColor = UIColor.red;
    field.text = value;
    let when = DispatchTime.now() + 0.5;
    DispatchQueue.main.asyncAfter(deadline: when){
        field.textColor = UIColor.black;
        field.text = value;
    }
}
```

```
DHTref.observe(.value, with: {
       (datasnapshot:DataSnapshot) -> Void in
       if let dhtDict = datasnapshot.value as? [String:String]{
         if self.HumidityField.text != "濕度:\(dhtDict["Humidity"]?? "不明")"{
            let newValue = "濕度:\(dhtDict["Humidity"]?? "不明")"
            self.delay(targetField: self.HumidityField, changedValue:
newValue);
         if self.FahrenheitField.text != "華氏:\(dhtDict["Fahrenheit"]??"不
明")"{
            let newValue = "華氏:\(dhtDict["Fahrenheit"]?? "不明")";
            self.delay(targetField: self.FahrenheitField, changedValue:
newValue);
         if self.FahrenheitIndexField.text != "華氏指數:\
(dhtDict["FahrenheitIndex"]??"不明")"{
            let newValue = "華氏指數:\(dhtDict["FahrenheitIndex"]??"不明")";
            self.delay(targetField: self.FahrenheitIndexField, changedValue:
newValue);
         if self.CelsiusField.text != "攝氏:\(dhtDict["Celsius"]?? "不明")"{
            let newValue = "攝氏:\(dhtDict["Celsius"]?? "不明")";
            self.delay(targetField: self.CelsiusField, changedValue: newValue);
         if self.CelsiusIndexField.text != "攝氏指數:\(dhtDict["CelsiusIndex"]??
"不明")"{
            let newValue = "攝氏指數:\(dhtDict["CelsiusIndex"]?? "不明")";
            self.delay(targetField: self.CelsiusIndexField, changedValue:
newValue);
    });
```
